

# features & benefits

The robust Ultraframe system just got tougher with the introduction of the gable support system. In layman's terms this is a "intel" across either end of a lean-to or the front of a gable style conservatory, particularly applicable on those designs that incorporate double doors in the gable elevation.

- Suitable for lean-to's, and gable style conservatories.
- Gives increased structural stability and integrity - especially in designs where double doors are featured in the same elevation - stops side "frame wobble".
- Comes complete with "infill wedges" to aid rake frame manufacturing - suits 60-70mm frames.
- Internally, allows decorative option, Ultraselect to run all the way round.
- Removes the need for additional soakaway's and drainage work as gutter can be continuous right around the conservatory.
- Suitable for 10-40° pitches, available in two whites and mahogany woodgrain.
- Suitable for widths/projections of up to 4m unreinforced and 5 m reinforced (width only).

the system comprises of :-

- An aluminium beam
- Claddings
- Reinforcement (over 4m and up to 5m in width)
- Infill wedges to aid raked frame manufacturing
- Guttering and rain water pipe drop
